

Stefan Leucht
Technical University München, Germany

The section of evidence-based medicine in psychiatry, led by Prof. Leucht, has 20 years of experience in producing systematic reviews and meta-analyses of treatments for schizophrenia.

The content of the internship will be to learn the principles of pairwise meta-analysis based on a concrete project in schizophrenia research, starting from how to do a protocol, how to do a systematic search and how to do the meta-analytic calculations.

The exact topic will be defined together with the intern so that his/her personal interests can be taken into account.

The department will provide all necessary material, in particular working space, a computer and the software needed to run meta-analysis.

When the intern returns to his/her home department he/she will be able to finish the systematic review with continued supervision by Prof. Leucht via e-mail, skype etc. The aim is a longstanding mentorship and collaboration on meta-analyses.
